

Best Practice Search Queries:

The following information was provided by Alex from the Central Sydney Division.

Best Practice comes pre-loaded with over 150 search queries that practices can use to find patients that match certain criteria.

A complete list of queries is follows the usage instructions.

The pre-loaded queries search for predefined data, but you can modify the queries yourself. For instance, say you wanted to receive a list of all patients that have had a certain blood test, you can modify the "Patients who have had certain path tests" sql statement. This really is "under the hood" type stuff, so familiarity with SQL statements would be helpful. Most people should be able to change simple things like search terms.

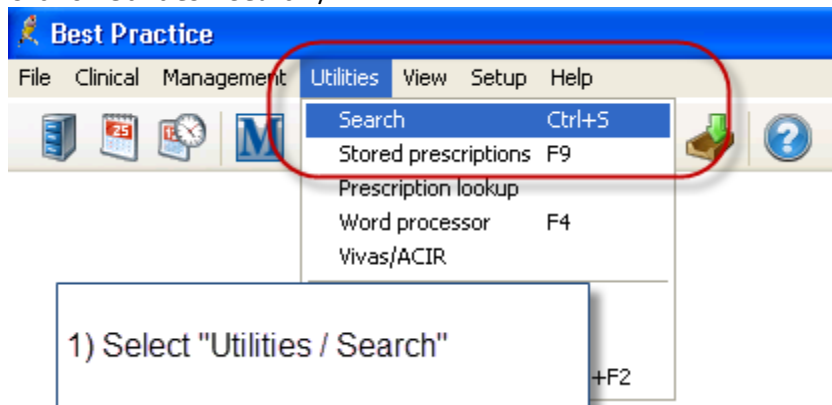

The pre-loaded queries (sql) are stored in the following folder:

"C:\Program Files\Best Practice Software\BPS\SuppliedQueries"

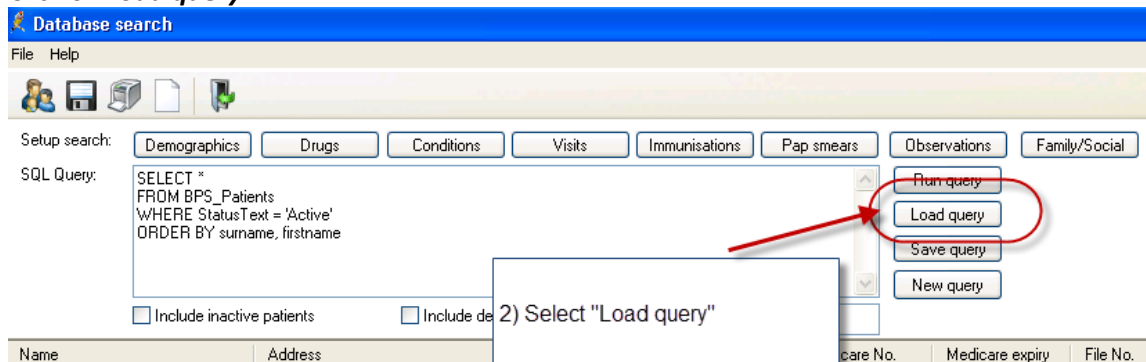

If Best Practice is not installed in the default location, you will need to specify the correct location.

Running a pre-loaded search query:

1. Click on **Utilities – Search./**

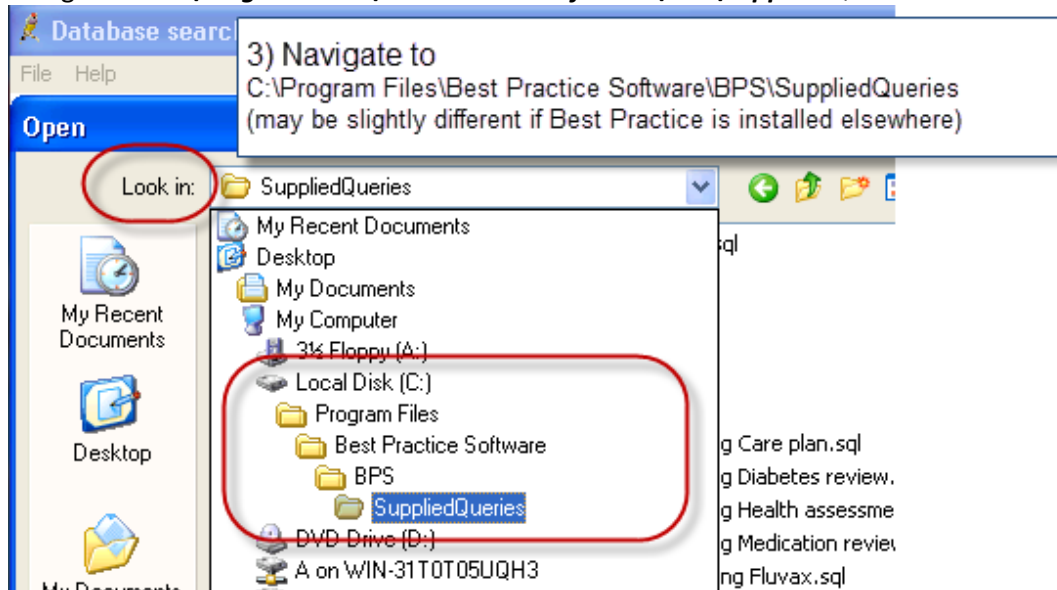

2. Click on **Load query.**

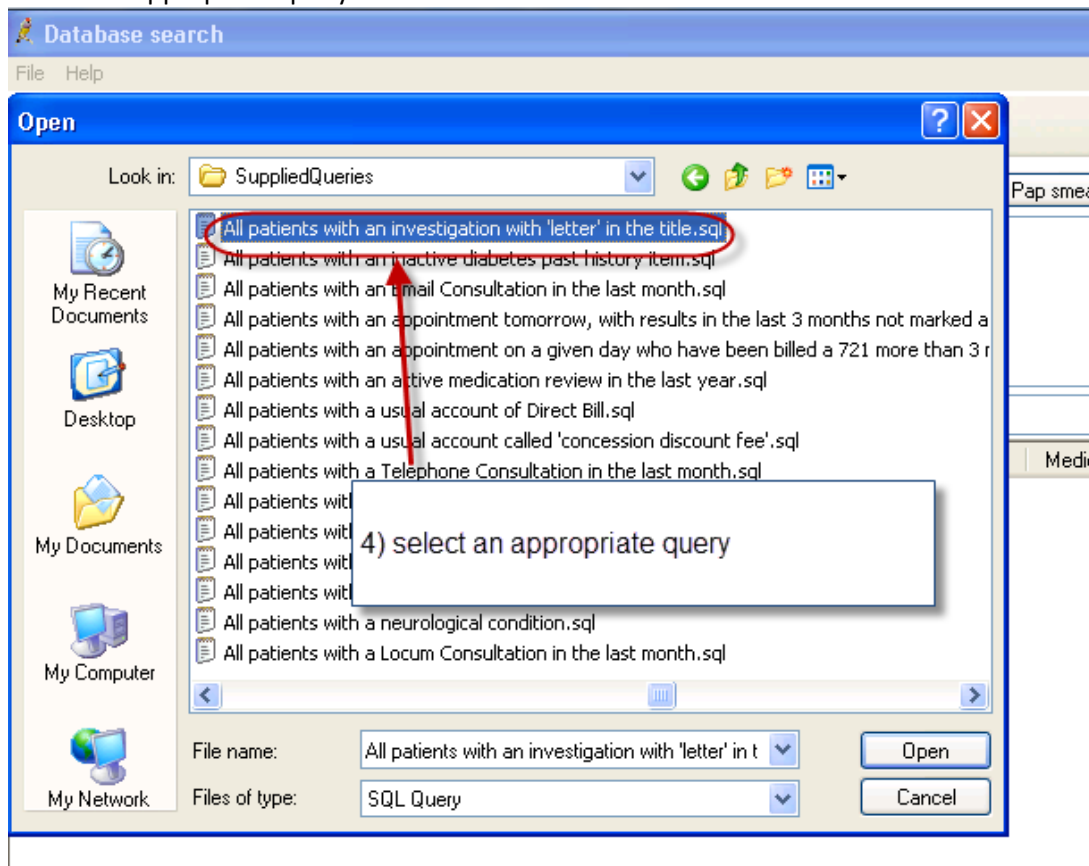

3. Navigate to "**C:\Program Files\Best Practice Software\BPS\SuppliedQueries**"

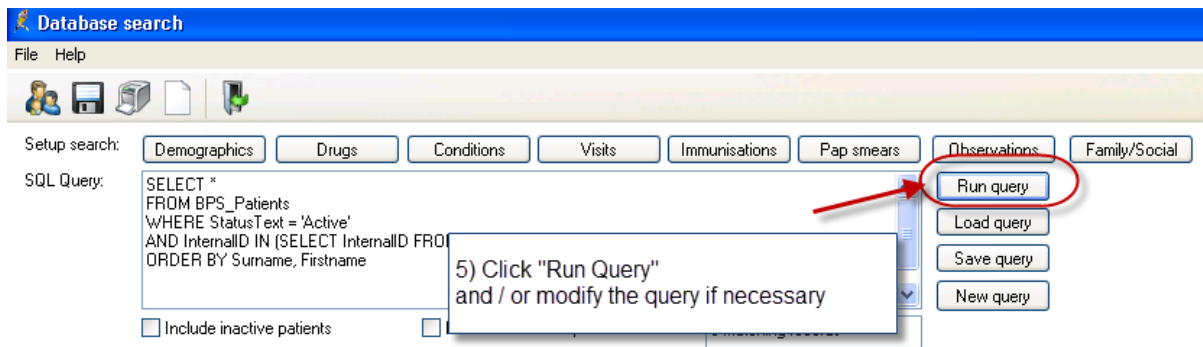

4. Select the appropriate query.

5. Click on **Run query**. A list of patients that match the search criteria should then be displayed.

List of available queries in Best Practice

- 2011 Free flu eligibility (+neurological conditions)
- 2011 Free flu eligibility
- Age below 16 with Immunizations in last year
- Age over 75 with visit in last year
